Abstract

We investigate the effect on primitive words of point mutations (inserting or deleting symbols, substituting a symbol for another one), of morphisms, and of the operation of taking prefixes. Several ways of producing primitive words are obtained in this framework. © 2002 Elsevier Science B.V. All rights reserved.

Keywords: Word; Language; Primitive; Density; Morphism; Insertion; Deletion

1. Primitive words; prerequisites

The primitive words, those which cannot be written as the power of another word, play an important role in formal language theory, coding theory, combinatorics on words, etc. In spite of the fact that many researches were devoted to them, still the subject is far from being exhausted. It is enough to mention the open problem whether or not the language of all primitive words over a given alphabet is context-free; see [2,5], and their references.

For an alphabet $V$, we denote by $V^*$ the free monoid generated by $V$ under the operation of concatenation; the empty word is denoted by $\lambda$ and $V^* - \{\lambda\}$ is denoted by $V^+$. For $x \in V^*$, $|x|$ is the length of $x$, $|x|_a$ is the number of occurrences in $x$ of the symbol $a \in V$, and $\text{alph}(x)$ is the set of symbols appearing in $x$. We also denote by $\text{pref}(x)$ the set of all non-empty prefixes of $x$. For a language $L \subseteq V^*$, we put $\text{length}(L) = \{|x| \mid x \in L\}$. The cardinality of a set $X$ is denoted by $\text{card}(X)$.

For elementary notions and results of formal language theory, we refer to [7].

In what follows, $V$ is always an alphabet containing at least two symbols.
A word \( x \in V^+ \) is said to be primitive if \( x = u^n, u \in V^+ \), implies \( n = 1 \) (hence \( x = u \)). Note the fact that the empty word is not primitive. For every word \( x \in V^+ \) there is a unique primitive word \( u \) and a unique integer \( m \geq 1 \) such that \( x = u^m \); the word \( u \) is called the root of \( x \).

The language of all primitive words over an alphabet \( V \) is denoted by \( Q_V \); when \( V \) is understood, we write simply \( Q \). The language of non-primitive words over \( V \) is denoted by \( Z_V \) (by \( Z \) when \( V \) is understood).

A language \( L \) is called reflective if \( uv \in L \) implies \( vu \in L \), for any \( u, v \in V^* \).

Several facts about primitive words are known; we recall some of them which will be useful below; proofs can be found in [1,8].

**Lemma 1.**

(i) If \( uv = vu, u, v \in V^+ \), then \( u = p^m, v = p^n \), for some \( p \in Q \) and \( n, m \geq 1 \).

(ii) (The periodicity theorem of Fine and Wilf). If \( u^m, v^n \) have a common prefix of length at least \( |u| + |v| - 1 \), then \( u \) and \( v \) are powers of the same word.

(iii) The languages \( Q \) and \( Z \) are reflective.

**Lemma 2.**

(i) If \( u \in V^+, u \neq a^n \) for some \( a \in V, n \geq 1 \), then at least one of the words \( u, ua \) is primitive.

(ii) If \( u, v \in Q, u \neq v \), then \( u^m v^n \in Q \), for all \( m \geq 2, n \geq 2 \).

Point (i) in Lemma 2 has the following immediate consequence.

**Corollary 1.** If \( u_1, u_2 \in V^+, u_1 u_2 \neq a^n, a \in V, n \geq 1 \), then at least one of \( u_1 u_2, u_1 a u_2 \) is primitive.

This corollary suggests the following problem: start with a primitive word \( w \) and try to obtain new primitive words by inserting symbols into \( w \). More generally, consider point mutations (as, for instance, in the genetic area), that is insertions, deletions, or substitutions of a single symbol each. The next sections are devoted to investigating such operations. Still more generally, any operation with words can be considered from the point of view of primitivity preserving. Two natural cases investigated here are the morphisms and the operation \( \text{pref} \), of taking prefixes.

2. Insertion, deletion and primitivity

We start by a result related to Lemma 2(i) and Corollary 1 above.

**Proposition 1.** For every word \( u \in V^+ \) and every symbols \( a, b \in V, a \neq b \), at least one of the words \( ua, ub \) is primitive.

**Proof.** If \( u = a^i, i \geq 0 \), then \( ub \) is primitive, and if \( u = b^i, i \geq 0 \), then \( ua \) is primitive. Thus, we may assume that \( \text{alph}(u) \) is different from both \( \{a\} \) and \( \{b\} \).
Suppose that none of $ua, ub$ is primitive, hence there are $f, g \in Q$ such that $ua = f^n, ub = g^m$ for some $n \geq 2, m \geq 2$.

We cannot have $n = m$: if $n = m$, then $f = g$, which is impossible because $a \neq b$. Therefore, at least one of $n,m$ must be strictly greater than 2. Let us assume that $m \geq 3$; the case $n \geq 3$ is similar.

From the equations $ua = f^n, ub = g^m$, we obtain $|u| = n|f| - 1$, and $|u| = m|g| - 1$, hence $2|u| = n|f| + m|g| - 2$, that is $|u| = n2|f| + m2|g| - 1$. Therefore, making use of the relations $n \geq 2, m \geq 3$, we obtain $|u| \geq |f| + |g| - 1$.

Consequently, the words $f^n, g^m$ have a common prefix $u$ of length greater than $|f| + |g| - 1$. In view of Lemma 1(ii), it follows that $f = p^r, g = p^s$, for some $p \in V^+, r, s \geq 1$. Therefore, $ua = p^rn, ub = p^sm$, which is contradictory, because $a \neq b$. In conclusion, at least one of $ua, ub$ is primitive. 

This result has several rather interesting consequences, proving in some sense that “there are very many primitive words”.

**Corollary 2.** (i) For every word $u \in V^*$, at most one of the words $ua$, with $a \in V$, is not primitive. (ii) For every words $u_1, u_2 \in V^*$, at most one of the words $u_1au_2$, with $a \in V$, is not primitive.

**Proof.** (i) For a given $u \in V^*$, apply Proposition 1 for two symbols $a, b \in V$. If $ua$ is primitive, mark the symbol $a$, if $ub$ is primitive, mark the symbol $b$. At least a symbol is marked in this way. Continue by considering any two non-marked symbols. Eventually, at most one symbol remains unmarked, and this completes the proof. Assertion (ii) follows now from the reflectivity of $Q$. 

**Corollary 3.** If the language $L \subseteq V^*$ is infinite, then there is at least one letter $a \in V$ such that $L \{a\} \cap Q$ is infinite.

**Proof.** Let $a, b \in V$. If both $L \{a\}$ and $L \{b\}$ contain only a finite number of primitive words, then for some integer $n$ all the words of the form $ua, ub$ with $|u| \geq n$ will be non-primitive. However, by Proposition 1, $\{u\}V$ contains at most one non-primitive word, a contradiction. 

Corollary 2(ii) also has interesting consequences concerning the possibility of obtaining primitive words by deletion operations (of single symbols).

**Proposition 2.** Every word $w \in Q, |w| \geq 2$, can be written in the form $w = u_1au_2$, for some $u_1, u_2 \in V^*, a \in V$, such that $u_1u_2 \in Q$.

**Proof.** Take $w \in Q, |w| \geq 2$. Because of the primitivity, we can write $w = v_1av_2$, for some $v_1, v_2 \in V^*, a, b \in V$, with $a \neq b$. According to Corollary 2(ii), at least one of $v_1av_2$ and $v_1bv_2$ is primitive. The word $v_1av_2$ is obtained by erasing the symbol $b$ from $w = v_1av_2$ (hence, $u_1 = v_1a, u_2 = v_2$), whereas the word $v_1bv_2$ is obtained by erasing
the symbol $a$ from $w = v_1abv_2$ (hence $u_1 = v_1, u_2 = bv_2$). In each case, a symbol can be deleted from $w$ and the obtained word is primitive.

This proposition suggests to consider a robustness notion of the following type: a primitive word $w \in V^*$ is said to be del-robust if each symbol of $w$ can be erased such that the obtained words are all primitive. Symmetrically, we can consider ins-robust words, those which lead to primitive words irrespective where we insert irrespective which symbol of $V$.

It is worth noticing that there are primitive words of arbitrary length which are at the same time del-robust and ins-robust. An example is provided by the sequence of words

$$w_n = aba^2b^2 \ldots a^n b^n, \quad n \geq 2$$

over $V = \{a, b\}$. Removing any symbol from $w_n$ or inserting a symbol $a$ or $b$ in any position, we obtain primitive words: either $a^n$ or $b^n$ remains unchanged, hence no possibility appears of writing the obtained words as powers of other words.

3. Primitivity and density

Proposition 1 also suggests a series of developments related to the density of words in a language.

Let $k$ be a positive integer. A language $L \subseteq V^*$ is called right $k$-dense (strictly right $k$-dense) (see [3]) if for every $u \in V^*$ there exists a word $x \in V^*$, $|x| \leq k$ ($1 \leq |x| \leq k$), such that $ux \in L$. A language $L$ is right dense if it is $k$-dense for all $k \geq 1$.

Thus, Proposition 1 says that the language $Q$ is right 1-dense and therefore right $k$-dense for every $k$.

A minimal (strictly) right $k$-dense language $L$ is a (strictly) right $k$-dense language that contains no proper (strictly) right $k$-dense language. Remark that $\lambda \not\in L$.

It is proved in [3] that every right $k$-dense language contains a minimal right $k$-dense language. Consequently, also the language $Q$ contains a minimal right $k$-dense language, for each $k \geq 1$.

**Proposition 3.** Let $M$ be a minimal right 1-dense language of primitive words over some alphabet $V$. Then:

(i) $M \cap V \neq \emptyset$.

(ii) For every integer $n \geq 1$ and every $a \in V$ there exists $b \in V$, $b \neq a$, such that $a^n b \in M$.

(iii) If $M$ is minimal strictly right 1-dense and if $ua, ub \in M$ with $u \in V^*, a, b \in V$, then $a = b$.

**Proof.** (i) Since $M$ is right 1-dense, there exists $x \in V^*, |x| \leq 1$, such that $\lambda x \in M$. Since $\lambda$ is not primitive, it follows that $|x| = 1$ and $x \in M \cap V$. 

(ii) If $a \in V$ and $n \geq 2$, then $a^n$ is not primitive. Because of the right 1-density of $M$, there is $x$ with $|x| \leq 1$ such that $a^nx \in M$. This implies $x = b$ for some $b \in V, b \neq a$.

(iii) Suppose that $a \neq b$. The set $M - \{ub\}$ is not strictly right 1-dense and hence there is $v \in V^*$ such that $\{v\}V \cap (M - \{ub\}) = \emptyset$. Since $\{v\}V \cap M \neq \emptyset$, it follows that $vx \in M$ for some $x \in V$. From $vx \notin M - \{ub\}$ it follows that $vx = ub$. Since $x \in V$, then $x = b$ and $v = u$. Hence $\{u\}V \cap (M - \{ub\}) = \emptyset$ and, since $ua \in M - \{ub\}$, we have a contradiction. \qed

**Proposition 4.** Let $M$ be a strictly right 1-dense language of primitive words over some alphabet $V$. Then $M$ is minimal if and only if $ua, ub \in M$ for $u \in V^*, a, b \in V$, implies $a = b$.

**Proof.** ($\Rightarrow$) By Proposition 3(iii).

($\Leftarrow$) Suppose that $M$ is not minimal. Then there exists a language $L \subset M$ which is strictly right 1-dense. Let $v \in M - L, v \neq \lambda$. Then $v = ua$ for some $a \in V$. Since $L$ is right 1-dense, there is $b \in V$ such that $ub \in L$. Hence $ua, ub \in M$ and therefore $a = b$. This implies that $ua \in L$ and $ua \in M - L$, a contradiction. \qed

Using the previous result, it is possible to construct a minimal strictly 1-dense language of primitive words.

Let $V = \{a_1, a_2, \ldots, a_n\}, n \geq 2$. Consider the sequence of languages $U_i, i \geq 1$, defined as follows:

\[ U_1 = \{u \in V^* | ua_1 \in Q\}, \quad T_1 = V^* - U_1, \]
\[ U_2 = \{u \in T_1 | ua_2 \in Q\}, \quad T_2 = T_1 - U_2, \]
\[ \vdots \]
\[ U_i = \{u \in T_{i-1} | ua_i \in Q\}, \quad T_i = T_{i-1} - U_i, \]
\[ \vdots \]

The sequence $U_i, i \geq 1$, is finite because the alphabet $V$ is finite (the sequence must reach a set $U_{i+1}$ which is empty or $i = n$).

Let $U = U_1\{a_1\} \cup U_2\{a_2\} \cup \cdots \cup U_i\{a_i\}$. The language $U$ is a subset of $Q$. It is strictly right 1-dense, because for every $u \in V^*$ there is at least one $a_j$ such that $ua_j$ is primitive and it is minimal by construction and by Proposition 4.

### 4. Symbol substitutions and primitivity

For $x \in V^+$, consider the set

\[ \text{one}(x) = \{x_1bx_2 | x = x_1ax_2, \quad x_1, x_2 \in V^*, a, b \in V, a \neq b\}. \]

Consider a language $L \subseteq V^+$ and a word $x \in L$. We say that $x$ is subst-robust (with respect to $L$) if $\text{one}(x) \subseteq L$. 
It is easy to see that $Q$ contains both subst-robust and non-subst-robust words of arbitrary length. For instance,
\[
w_n = aba^2b^2 \ldots a^n b^n, \quad n \geq 3
\]
are subst-robust, whereas
\[
z_n = ba^n, \quad n \geq 1
\]
are not. (Note that $w_2 = abaabb$ is not subst-robust: replacing the second occurrence of $a$ by $b$, we get the non-primitive word $abbabb$.)

**Lemma 3.** If $L$ consists of only subst-robust words, then $L = \{ w \in V^* \mid |w| \in \text{length}(L) \}$.

**Proof.** Take $x \in L, x = a_1 a_2 \ldots a_n$. Because $x$ is subst-robust, each word $a_1 \ldots a_{i-1} b_i a_{i+1} \ldots a_n$ is in $L$. In turn, these words are subst-robust, hence one more symbol of them can be changed. Continuing in this way, each word $y$ such that $|x| = |y|$ is proved to be in $L$, which implies the inclusion $\{ w \in V^* \mid |w| \in \text{length}(L) \} \subseteq L$. The converse inclusion is obvious. \(\Box\)

**Corollary 4.** If $L \subseteq V^*$ is a context-free language such that all its words are subst-robust, then $L$ is regular.

Although not all primitive words are subst-robust in the sense defined above, a weaker notion of robustness is verified at least for alphabets with more than two symbols.

**Proposition 5.** If $V$ contains at least three symbols, then for each word $x \in V^*$ and for each decomposition $x = x_1 ax_2, x_1, x_2 \in V^*, a \in V$, there is $b \in V, b \neq a$, such that $x_1 bx_2$ is primitive.

**Proof.** Consider a word $x \in V^*$ and a decomposition $x = x_1 ax_2$ as above. Consider the words $x_1 cx_2$ with $c \in V$. According to Corollary 2(ii), at most one is not primitive. Because $V$ contains at least three distinct symbols, there is $b \in V - \{a\}$ for which $x_1 bx_2$ is primitive. \(\Box\)

If we start with $x \in V^*, x \in Z$, then all substitutions lead to primitive words: we know that $x = x_1 ax_2$ is not primitive, hence from Corollary 2(ii) all words $x_1 bx_2, b \neq a$, are primitive. The argument holds even for $V = \{a, b\}$.

The assertion in Proposition 5 does not hold true for $V = \{a, b\}$: in $abaabb$ we cannot replace the second occurrence of $a$ by $b$, or the last occurrence of $b$ by $a$ without losing the primitivity. However, we have the following result.

**Proposition 6.** If $V = \{a, b\}$, then for each word $x \in V^*, |x| \geq 3$, and for each decomposition $x = x_1 \alpha \beta x_2, x_1, x_2 \in V^*, \alpha, \beta \in V$, at least one of the words $x_1 \alpha' \beta' x_2, x_1 \alpha' \beta x_2$ is primitive, where $\alpha, \beta \in V, \alpha' \neq \alpha$ and $\beta' \neq \beta$. 
**Proof.** Take \( x = x_1 x_2 x \) as above \( x, \beta \in V, |x_1 x_2| \geq 1 \). In view of the reflectivity of \( Q \), it is enough to prove that at least one of \( x_2 x_1 x' \beta, x_2 x_1 x' \beta' \) is primitive. Assume the contrary, that is \( x_2 x_1 x' \beta = f^n \), and \( x_2 x_1 x' \beta' = g^m \), for some \( n \geq 2, m \geq 2 \) and \( f, g \in Q \). As in the proof of Proposition 1, we may assume that at least one of \( n, m \) is greater than or equal to 3; assume that \( m \geq 3 \).

If \( |g| = 1 \), then \( x_2 x_1 x' \beta' = g^m \), for some \( g \in \{a, b\} \). Because \( x' \neq x, \beta' \neq \beta \), it follows that \( x_2 x_1 x' \beta \) is primitive, a contradiction to the previous assumption. Thus, we may assume that \( |g| \geq 2 \).

We have \( |x_2 x_1| = n |f| - 2 \), and \( |x_2 x_1| = m |g| - 2 \), which implies \( |x_2 x_1| = n |f| + m/2 |g| - 2 \). Because \( n \geq 2 \) and \( m \geq 3 \), we get \( |x_2 x_1| \geq |f| + |g| + 1/2 |g| - 2 \). Because \( |g| \geq 2 \), we conclude that \( |x_2 x_1| \geq |f| + |g| - 1 \). From Lemma 1(ii), we obtain that \( f \) and \( g \) are powers of the same primitive word, which is impossible because \( x' \neq x \) and \( \beta' \neq \beta \). In conclusion, at least one of \( x_2 x_1 x' \beta, x_1 x' \beta' x_2 \) is primitive. \( \square \)

The condition \( |x| \geq 3 \) in the theorem is necessary: for \( x = ab \), none of the words \( aa \) and \( bb \) is primitive. Note also that \( ab \) is primitive, hence the condition of \( x \) being primitive does not help.

5. Taking prefixes and primitivity

Consider now the operation \( \text{pref} \). Let \( L \subseteq V^+ \) be a given language.

We say that \( x \in L \) is \( \text{pref-robust} \) (with respect to \( L \)) if \( \text{pref}(x) \subseteq L \). We denote by \( L_{pr} \) the set of all \( \text{pref-robust} \) words in \( L \).

It is easy to see that there are primitive words of arbitrary length which are \( \text{pref-robust} \): \( ba^n, n \geq 1 \), and \( aba^2 b^2 \ldots a^n b^n, n \geq 1 \), are such examples.

**Proposition 7.** The language \( Q_{pr} \) is not context-free.

**Proof.** Consider the regular language \( R = ba^+ ba^+ ba^+ ba^+ \). Intersecting \( Q_{pr} \) with \( R \) we obtain

\[
Q_{pr} \cap R = \{ ba^n ba^n ba^n ba^n \mid n_1, n_2, n_3, n_4 \geq 1, n_1 > n_2 \text{ and } (n_1 \neq n_3 \text{ or } n_2 > n_4) \}.
\]

The inclusion \( \supseteq \) is obvious. Conversely, take a word \( x = ba^n ba^n ba^n ba^n \in Q_{pr} \cap R \). Because \( \text{pref}(x) \subseteq Q \), we must have

1. \( n_1 > n_2 \) (otherwise \( ba^n ba^n \in \text{pref}(x) - Q \)) and
2. \( n_1 \neq n_3 \text{ or } n_2 > n_4 \) (otherwise \( ba^n ba^n ba^n ba^n \in \text{pref}(x) - Q \)).

Because \( x \in \text{pref}(x) \), no further restriction is entailed by the fact that \( x \in Q \). Consequently, also the inclusion \( \subseteq \) holds.
Using a sequential transducer (a gsm), we can now translate $Q_{pr} \cap R$ into the language

$$L = \{a^n b^n c^n d^n \mid n_1, n_2, n_3, n_4 \geq 1, \quad n_1 > n_2 \text{ and } (n_1 \neq n_3 \text{ or } n_2 > n_4)\}.$$  

This is not a context-free language. Indeed, assume that $L$ is context-free. Then $L$ has to satisfy Ogden’s lemma, that is there is a constant $N$ such that every $z \in L$ in which at least $N$ symbols are considered marked can be written in the form $z = uvwxy$ such that the following conditions hold:

(i) $vx$ contains at most $N$ marked symbols, (ii) $v$ and $x$ together have at least one marked symbol, (iii) for all $i \geq 0$, $uv^iwx^iy \in L$.

Consider a constant $N$ associated to $L$ as in Ogden’s lemma and let $z = a^n b^m c^n d^n$ with $n_1 = N + 1$, $n_2 = N$, $n_3 = (N + 1)! + N + 1$, and $n_4 = (N + 1)! + N + 1$. It is clear that $z \in L$ (we have $n_1 > n_2$ and $n_1 \neq n_3$). We mark all occurrences of the symbol $b$ in $z$ (there are at least $N$ such occurrences).

Let $z = uvwxy$ be a decomposition of $z$ which satisfies the conditions (i)–(iii) above. It is clear that neither $v$ nor $x$ may contain two different symbols. Condition (ii) implies that $|vx| = 1$. It suffices to consider the following two cases.

1. $vx$ does not contain any occurrence of $a$. Then $z'' = uv^2wx^2y$ should be in $L$ by condition (iii) in Ogden’s lemma. However, $|z''|_a = 1$, a contradiction.

2. $vx$ contains occurrences of $a$. Then, we obviously have $v = a^i$ and $x = b^j$ for some $i, j \geq 1$. If $i < j$, then for large enough $k$ we get words $z''' = uv^kwx^ky$ with $|z'''|_a < |z''|_b$, again contradicting point (iii) above. Therefore, we must have $i \geq j$.

Let

$$k = \frac{(N + 1)!}{i} + 1$$

and consider the word $z''' = uv^kwx^ky = a^{m_1}b^{m_2}c^{m_3}d^{m_4}$. We have

$$m_1 = ik + N + 1 - i = (N + 1)! + i + N + 1 - i = (N + 1)! + N + 1,$$

$$m_2 = jk + N - j \leq (N + 1)! + j + N - j = (N + 1)! + N,$$

$$m_3 = n_3 = (N + 1)! + N + 1,$$

$$m_4 = n_4 = (N + 1)! + N + 1.$$  

Consequently, $m_1 = m_3$ and $m_2 < m_4$, that is $z''' \not\in L$. Again, this contradicts Ogden’s lemma.

We conclude that $L$ is not context-free. Because the family of context-free languages is closed under intersection with regular languages and under sequential transducers, the language $Q_{pr}$ is not context-free. □

Unfortunately, proving that $Q_{pr}$ is not context-free does not imply that $Q$ is not context-free: there are context-free languages $L$ such that $L_{pr}$ is not context-free. An example is

$$L = \{a^n b^n a^n b \mid n, m \geq 1\} \cup \text{pref}(\{a^n b^n a^n \mid n, m \geq 1\}).$$
This is a linear language (over \( V = \{a, b\} \)). However,
\[
L_{pr} \cap a^+ b^+ a^+ b = \{a^n b^n d^n b \mid n \geq 1\},
\]
which is non-context-free. (The equality above is obvious: the prefix \( a^n b^n a^n \) of \( a^n b^n a^m b \) is in \( L \) only if \( a^n b^n a^n \in \text{pref}(\{a^n b^n a^n \mid p, q \geq 1\}) \), which implies \( n = m \).)

6. Morphisms and primitivity

The behavior of morphisms with respect to primitivity has been considered previously, in particular in [4, 10]. For a morphism \( f \) that is injective, it has been shown in [4] that \( f(Q) \cap Q \) is infinite when \( |V| = 2 \). As shown below, this is in fact a characteristic property of injective morphisms for alphabets containing two letters.

Recall (see [9]) that a morphism \( f \) is injective if and only if \( f(V) \) is a code and \( |f(V)| = |V| \). Also a language \( \{u, v\} \subseteq V^+ \) is a code if and only if \( uv \neq vu \).

A morphism \( f \) is said to be \( \lambda \)-free if \( \lambda \notin f(V) \).

Lemma 4. Let \( V = \{a, b\} \) and let \( f \) be a \( \lambda \)-free morphism such that \( |f(V)| = |V| \). If \( f \) is not injective, then \( f(a) = p^n, f(b) = p^n \) for some \( p \in Q \).

Proof. Since \( f \) is not injective, then \( f(V) = \{f(a), f(b)\} \) is not a code. Therefore, \( f(a)f(b) = f(b)f(a) \) and, by Lemma 1(i), \( f(a) = p^n, f(b) = p^n \) for some \( p \in Q \). \( \square \)

Proposition 8. Let \( f \) be a \( \lambda \)-free morphism of \( V^* \) with \( V = \{a, b\} \). Then the following properties are equivalent:
(i) \( f \) is injective,
(ii) \( f(Q) \cap Q \) is infinite.

Proof. (i) \( \rightarrow \) (ii). The words \( a^n b^n \) are primitive for all \( n \geq 1 \). Let \( u = a^n b^n \) with \( m \geq 2 \) and suppose that \( f(u) \) is not primitive. Let \( f(a) = p^r, f(b) = q^s \) where \( p, q \in Q \). Then \( f(u) = p^rmq^sm \) with \( rm, sm \geq 2 \). Since \( f(u) \) is not primitive, this is only possible if \( p = q \) (Lemma 2(ii)). Hence \( f(ab) = f(ba) \), a contradiction.

(ii) \( \rightarrow \) (i) Suppose that \( f \) is not injective. If \( |f(V)| = |V| \), then by Lemma 4 \( f(a) = p^n, f(b) = p^n \). Hence \( f(V^+) \subseteq p^+ \) and \( f(Q) \cap Q \) is finite, a contradiction.

If \( |f(V)| = 1 \), then \( f(a) = f(b) \). Let \( u = f(a) \). Then \( f(V^+) = u^+ \) and \( f(Q) \cap Q \) is finite, a contradiction. \( \square \)

If the alphabet \( V \) has more than two letters, the above proposition is no longer true. For example, let \( V = \{a, b, c\} \) and let \( f \) be defined by \( f(a) = a, f(b) = ab, f(c) = aba \). This morphism is not injective because \( f(ba) = f(c) \). However, \( f(Q) \cap Q \) is infinite because \( a^n b^n \in Q \) and \( f(a^n b^n) \in Q \) for \( n \geq 1 \).
Lemma 5. Let $f$ be a $\lambda$-free morphism of $V^*$ with $|V| \geq 2$. Then the following properties are equivalent:

(i) $f$ is injective;
(ii) $f(uv) = f(vu)$ implies $uv = vu$ for all $u, v \in V^*$.

Proof. (i) $\rightarrow$ (ii). Immediate.

(ii) $\rightarrow$ (i) Suppose that $f(u) = f(v)$. Then $f(u) = f(v)$ $\Rightarrow$ $uv = vu$ and $u = pm^n$, $v = p^n$ with $p \in Q$. Hence $f(p)^n = f(u) = f(v) = (f(p))^n$. Since $f(p) \neq \lambda$, we have $m = n$ and $u = v$.

Corollary 5. If $f$ is injective, then $f(uv) = f(vu)$ implies $f(u) = p^n$, $f(v) = p^n$ with $p \in Q, m, n \geq 1$.

Proof. Since $uv = vu$, then $q = q'$, $v = q^s$ and $f(q) = p^k$ for some $q, p \in Q, r, s, k \geq 1$. Therefore, $f(u) = p^n, f(v) = p^n$ with $m = kr, n = ks$.

Let $f$ be a morphism of $V^*$. Denote by $f_Q$ the set of all the primitive words $u \in Q$ such that $f(u) \in Q$ and by $f_Z$ the set of all the primitive words $u \in Q$ such that $f(u) \in Z$, i.e. $f(u) = p^n, p \in Q, n \geq 2$.

Proposition 9. Let $f$ be a morphism of $V^*$. Then:

(i) The languages $f_Q$ and $f_Z$ are reflective.
(ii) If $f$ is injective, then $u, v \in f_Z$, $u \neq v$ imply $uw \not\in f_Z$ and $vw \in Q$.

Proof. (i) If $f_Q = \emptyset$, this is immediate. Suppose $f_Q \neq \emptyset$ and let $uw \in f_Q$. Then $uw \in Q$ and $f(u)f(v) = f(u) \in Q$. Since $Q$ is reflective, then $vu \in Q$ and $f(vu) = f(v)f(u) \in Q$. Therefore, $vu \in f_Q$.

If $f_Z = \emptyset$, this is immediate. Suppose $f_Z \neq \emptyset$ and let $vw \in f_Z$. Then $vw \in Q$. Since $Z$ is reflective, then $f(u)f(v) = f(u) \in Z$. Therefore, $vu \in f_Z$.

(ii) We have $f(u) = p^m, f(v) = q^n$ with $p, q \in Q$ and $m, n \geq 2$. Since $u \neq v$ and $u, v \in Q$, then $p \neq q$. Indeed if $p = q$, then $f(u) = f(v)$ and $w = vu$ because of the injectivity of $f$. This implies that $u, v$ are powers of the same primitive word, a contradiction. Hence $f(uv) = p^m q^n$ with $p \neq q$. By Lemma 2(ii), this implies $f(uv)$ primitive. Therefore, $w \not\in f_Z$ and $uv \in Q$.

If $f$ is a morphism of $V^*$, the word $u$ is said to be $f$-reductible if $f(u) = p^m, p \in Q, m \geq 2$. Since $Q$ and $Z$ are reflective, then $uw$ is $f$-reductible if and only if $vu$ is $f$-reductible. Remark that if $\lambda \not\in f(V)$, then every non-primitive word is $f$-reductible.

Proposition 10. Let $f$ be an injective morphism of $V^*$ and let $u$ be an $f$-reductible word. If $u = u_1 w u_2$ with $w u_2 u_1 \neq u_2 u_1 w$ and if $w$ is $f$-reductible, then $v = u_1 u_2$ is primitive and $v$ is not $f$-reductible.
Proof. Suppose that \( v = u_1 u_2 \) is \( f \)-reductible. Then \( u_2 u_1 \) is also \( f \)-reductible and \( f(u_2 u_1) = r^k \), \( r \in Q, k \geq 2 \). We have \( f(u) = f(u_1) f(w) f(u_2) = p^m, p \in Q, m \geq 2 \). Since \( f(u) \in Z \) which is reflective, then \( f(w) f(u_2) f(u_1) \in Z \) i.e. \( f(w) f(u_2) f(u_1) = q^n, q \in Q, n \geq 2 \). Since \( w \) is \( f \)-reductible, then \( f(w) = s^k, s \in Q, k_2 \geq 2 \). Hence,

\[
f(w) f(u_2 u_1) = s^k f(u_2 u_1) = s^k r^k = q^n.
\]

We have \( s \neq r \). Indeed if \( s = r \), then \( f(w u_2 u_1) = f(u_2 u_1 w) \) and, since \( f \) is injective, \( w u_2 u_1 = u_2 u_1 w \), against our hypothesis. By Lemma 2(ii), it follows then that \( q^n, n \geq 2 \), is primitive, a contradiction.

Therefore, \( v \) is not \( f \)-reductible and hence \( v \) is primitive. \( \square \)

Corollary 6. Let \( f \) be an injective morphism and let \( u \) be an \( f \)-reductible word such that \( u = u_1 x^n u_2, m \geq 2, x \neq \lambda \) and \( x^n u_2 u_1 \neq u_2 u_1 x^m \). Then \( u_1 u_2 \) is primitive and not \( f \)-reductible.

Proposition 11. Let \( f \) be an injective morphism of \( V^* \).

(i) If \( u, v \in V^+ \) with \( u \neq v \) are \( f \)-reductible, then \( uv \) is not \( f \)-reductible.

(ii) If \( uv \) is \( f \)-reductible and \( uv \neq vu \), then either \( u \) or \( v \) is not \( f \)-reductible.

Proof. (i) Since \( u \) and \( v \) are \( f \)-reductible, then \( f(u) = p^m, f(v) = q^n \) where \( p, q \in Q, m,n \geq 2 \). If \( p = q \), then \( f(uv) = p^{m+n} = f(vu) \). Since \( f \) is injective, then \( uv = vu \), a contradiction. Hence \( f(uv) = p^m q^n \) with \( p \neq q, m,n \geq 2 \). From Lemma 2(ii), it follows then that \( f(uv) \in Q \) and therefore \( uv \) is not \( f \)-reductible.

(ii) Suppose that both \( u \) and \( v \) are \( f \)-reductible. Then \( f(u) = p^m, f(v) = q^n \), \( p, q \in Q, m,n \geq 2 \). From \( uv \neq vu \) and the injectivity of \( f \) follows \( p \neq q \). By Lemma 2(ii), \( f(uv) = p^m q^n \) is primitive, a contradiction. \( \square \)

A word \( u \in V^+ \) is said to be \textit{universally-primitive} or \textit{simply \( u \)-primitive} if for every injective morphism \( f \) of \( V^* \), the word \( f(u) \) is primitive. Hence a \( u \)-primitive word is a word that is not \( f \)-reductible for every injective morphism of \( V^* \). Let \( Q_U \) denote be the set of all the \( u \)-primitive words of \( V^* \). Clearly \( Q_U \subseteq Q \). Since \( V \cap Q_U = \emptyset \), the inclusion is strict.

Proposition 12. Let \( w = u^n v^n \) with \( u, v \in V^+ \) and \( m,n \geq 2 \). Then the following properties are equivalent:

(i) \( w \) is \( u \)-primitive;

(ii) \( u \) and \( v \) have different roots;

(iii) \( w \neq vu \).

Proof. (i) \( \rightarrow \) (ii) If \( u \) and \( v \) have the same root \( p \), then \( w = p^k \) for some \( k \geq 2 \) and hence \( w \) is not primitive, a contradiction.

(ii) \( \rightarrow \) (iii) If \( uv = vu \), then \( u = p^r, v = p^s \) for some primitive word \( p \). This again implies that \( w \) is not primitive.
(iii) → (i) If \( uv \neq vu \), then \( u = p^\ast, \ v = q^\ast \) for some \( p, q \in Q \) and \( p \neq q \). Therefore, \( w = p^m q^n \) with \( rm, sn \geq 2 \). This implies that \( w \) is primitive. Let \( f \) be an injective morphism and let \( f(p) = p_1^m, f(q) = q_1^n \) with \( p_1, q_1 \in Q, m_1, n_1 \geq 1 \). We have \( p_1 \neq q_1 \). If not, then \( f(uv) = f(vu) \) and since \( f \) is injective, \( uv = vu \), a contradiction. Hence, \( f(w) = p_1^{rm} q_1^{sn} \) with \( p_1, q_1 \in Q, p_1 \neq q_1, m_1 rm, n_1 sn \geq 2 \). By Lemma 2(ii), this implies \( f(w) \) is primitive and therefore \( w \) is \( u \)-primitive.

**Corollary 7.** The set \( Q_U \) is infinite.

**Proof.** Let \( a, b \in V \). Then the set \( \{a^n b^m | n \geq 2\} \) contains only \( u \)-primitive words and hence \( Q_U \) is infinite.

**Proposition 13.** If \( f \) is an injective morphism, then \( T = f(Q - Q_U) \cap Q \neq \emptyset \).

**Proof.** Without loss of generality, we can assume that \( V = \{a, b\} \). The words \( a, b, ab \) are not \( u \)-primitive. Indeed, the morphisms \( g \) defined by \( g(a) = a^2, g(b) = b^2 \) and \( h \) defined by \( h(a) = aba, h(b) = b \) are injective. This implies that \( a \) and \( b \) are not \( u \)-primitive. Since \( h(ab) = (ab)^2 \), then \( ab \) is also not \( u \)-primitive.

Suppose now that \( T = \emptyset \). Then, since \( a, b, ab \) are not \( u \)-primitive, \( f(a), f(b) \) and \( f(ab) \) are not primitive. This implies in particular that \( f(a) = p^m \) and \( f(b) = q^n \) for some \( p, q \in Q, m, n \geq 2 \). Since \( f \) is injective, we have \( p \neq q \). From \( f(ab) = f(a) f(b) = p^m q^n \), it follows by Lemma 2(ii) that \( f(ab) \in Q \), a contradiction.

**Remark 1.** Words of the form \( p^m q^n, p, q \in Q, p \neq q, m, n \geq 2 \) are \( u \)-primitive (Proposition 12). However, not all \( u \)-primitive words are of this form.

For instance, the word \( u = a^r b^n a^r \) with \( a, b \in V, r + s, n \geq 2 \) is \( u \)-primitive. Suppose not. Then for some injective morphism \( f \), the word \( f(u) = f(a)^r f(b)^n f(a)^r \) is not primitive. Hence \( f(u) \in Z \) which is reflective. This implies that

\[
w = f(b)^n f(a)^r f(a)^r = f(b)^n f(a)^{s+r} \in Z
\]

and therefore \( w \) is not primitive. By Lemma 2(ii), this is only possible if \( f(a) \) and \( f(b) \) have the same roots. This implies \( f(ab) = f(ba) \), a contradiction since \( f \) is injective.

In particular, the word \( ab^2 a \) is \( u \)-primitive. However, this word cannot be written in the form \( p^m q^n, m, n \geq 2 \).

**Remark 2.** If a \( u \)-primitive word \( u \) has a decomposition of the type \( p^m q^n, p, q \in Q, p \neq q, m, n \geq 2 \), this decomposition is not necessarily unique.

For example, let \( V = \{a, b\} \) and let \( p_1 = ababab, p_2 = bababab, q_1 = ab, q_2 = bababab \). Then \( p_1, p_2, q_1, q_2 \in Q, p_1 \neq p_2, q_1 \neq q_2 \). Then the following word \( u \) is \( u \)-primitive and has at least two such different decompositions:

\[
u = p_1^2 p_2^2 = abababababababababababab = q_1^2 q_2^3.
\]
Remark 3. Words of the type $p_1^n p_2^m$ with $p_1, p_2 \in Q, p_1 \neq p_2$, $m, n \geq 2$ are $u$-primitive and hence primitive. This result cannot be extended further. For example, if $a, b \in V$, the words $a, b$ and $a^2b^2$ are primitive, but the word $u = a^2b^2(a^2b^2)^2$ is not primitive.

The word $u$ in the above example is of the form $p^i q^j (p^i q^j)^m$ and it is not primitive. However, as shown below, words of this form are in general $u$-primitive.

Proposition 14 (Shyr and Yu [9]). Let $V$ with $|V| \geq 2$ and let $p, q \in Q, p \neq q$. Then:

$$u = p^i q^j (p^i q^j)^m \in Q \text{ for } j, m \geq 1, i \geq 0, r \geq 2, i \neq r.$$

Proposition 15. Every word $u$ of the form (1) is $u$-primitive.

Proof. Let $f$ be an injective morphism and let $f(p) = p_1^i, f(q) = q_1^j$ with $p_1, q_1 \in Q, s, t \geq 1$. Since $f$ is injective, then $f(p) \neq f(q)$ and $f(pq) \neq f(qp)$. This implies that $p_1 \neq q_1$. We have $f(u) = p_1^i q_1^j (p_1^i q_1^j)^m$, with $t, m \geq 1, s_i \geq 0, r \geq 2$ and $s_i \neq r$.

By Proposition 14, it follows then that $f(u)$ is primitive. Since this is true for every injective morphism, the word $u$ is $u$-primitive.

7. Final remarks

One can consider other operations with words from the point of view of primitivity preserving.

One candidate is the interchanging of adjacent symbols. We believe that a result of the following type is true: for every $w \in Q_V, w \notin \{abba \mid a, b \in V, a \neq b\}$, there is a decomposition $w = x_1 c d x_2, x_1, x_2 \in V^*, c, d \in V, c \neq d$, such that $x_1 d c x_2 \in Q_V$.

Acknowledgements

Useful remarks by two referees are gratefully acknowledged. In particular, a variant of Proposition 6 and Ref. [6] (where a result similar to our Proposition 1 can be found) were suggested by them.
